

Experiment Number: 6

Aim:

WAP for Tic-Tac-Toe using game playing algorithm.

Theory:

The min-max algorithm computes the min-max decision from the current state. It uses a simple recursive computation of the min-max values of each successor state, directly implementing the defining equations. The recursion process all the way down to the leaves of the tree, and then the min-max values are backed up through the tree as the recursion unwinds.

The min-max algorithm performs a complete depth-first exploration of the game tree. If the maximum depth of the tree is m , and there are b legal moves at each point, then the time complexity of the min-max algorithm is $O(bm)$. The space complexity is $O(bm)$ for an algorithm that generates all successors at once, or $O(m)$ for an algorithm that generates successors one at a time. For real games, of course, the time cost is totally impractical, but this algorithm serves as the basis for the mathematical analysis of games and for more practical algorithms.

Algorithm:

function MINIMAX-DECISION(state) returns an action

inputs: state, current state in game

$v \leftarrow \text{MAX-VALUE}(\text{state})$

return the action in $\text{SUCCESSORS}(\text{state})$ v

function MAX-VALUE(state) returns a utility value

if $\text{TERMINAL-TEST}(\text{state})$ then return $\text{UTILITY}(\text{state})$

Shivajirao S Jondhale College of Engineering, Dombivli (E)
Department of Computer Engineering

$v \leftarrow -\text{infinity}$

for a, s in $\text{SUCCESSORS}(\text{state})$ do

$v \leftarrow \text{MAX}(V, \text{MIN-VALUE}(S))$

return v

function MIN-VALUE

if $\text{TERMINAL-TEST}(\text{state})$ then return $\text{UTILITY}(\text{state})$

$V \leftarrow \text{infinity}$

for a, s in $\text{SUCCESSORS}(\text{state})$ do

$v \leftarrow \text{MIN}(V, \text{MAX-VALUE}(S))$

return v
